

Lecture 2: Classes of sets & the "Good sets" technique.

Part of the goal of this class is
to get exposure to the measure theory
that underpins probability theory. ①

This means that we will have to
endure a fair amount of technical definitions
etc before we can get to the good stuff.
Fix some set Ω , the sample space.

Let $2^{\Omega} :=$ power set of Ω .
= Set of all subsets of Ω .

Def: $\mathcal{F} \subset 2^{\Omega}$ is non-empty and
 $A \in \mathcal{F} \Rightarrow A^c \in \mathcal{F}$

Then \mathcal{F} is a...

field if $A, B \in \mathcal{F} \Rightarrow A \cup B \in \mathcal{F}$
 σ -field if $A_1, A_2, \dots \in \mathcal{F} \Rightarrow \bigcup_{k=1}^{\infty} A_k \in \mathcal{F}$
 λ -system if $A_1, A_2, \dots \in \mathcal{F} \Rightarrow \bigcup_{k=1}^{\infty} A_k \in \mathcal{F}$
 disjoint

Note: Many textbooks replace the non-empty
requirement by $\Omega \in \mathcal{F}$ or $\emptyset \in \mathcal{F}$
but closure under complement makes
them all equivalent definitions

Def: $\mathcal{M} \subset 2^{\Omega}$ is a monotone class
 $A_1, A_2, \dots \in \mathcal{M}$ & $A_n \uparrow A \Rightarrow A \in \mathcal{M}$
 $A_1, A_2, \dots \in \mathcal{M}$ & $A_n \downarrow A \Rightarrow A \in \mathcal{M}$

where $A_n \uparrow A$ means $\begin{cases} A_1 \subset A_2 \subset \dots \\ A = \bigcup_{k=1}^{\infty} A_k \end{cases}$

and $A_n \downarrow A$ means $\begin{cases} A_1 \supset A_2 \supset \dots \\ A = \bigcap_{k=1}^{\infty} A_k \end{cases}$

Note: we will sometimes write
 $\lim_n \uparrow A_n$ & $\lim_n \downarrow A_n$ for the monotonic
limits above.

Def: $\mathcal{P} \subset 2^{\Omega}$ is a π -system if
 $A, B \in \mathcal{P} \Rightarrow A \cap B \in \mathcal{P}$. ②

overview of important results.

$$1) \quad \mathcal{G} = \lambda + \Pi = \mathcal{F} + \mathcal{M}$$

$$2) \quad \mathcal{G}(\Pi) = \lambda(\Pi) \quad (\text{Dynkin's } \pi\text{-}\lambda \text{ Thm.})$$

$$3) \quad \mathcal{G}(\mathcal{F}) = \mathcal{M}(\mathcal{F}) \quad (\text{Halmos' monotone class thm.})$$

$$4) \quad \text{if probs } P = Q \text{ on } \Pi \text{ then } P = Q \text{ on } \mathcal{G}(\Pi). \quad \begin{array}{l} \text{The monotone class} \\ \text{generated by a field.} \\ \text{useful for Caratheodory Thm.} \end{array}$$

Let's look at some examples first.

Examples and Observations

e.g. $(\frac{1}{4}, \frac{1}{2} - \frac{1}{n}] \uparrow (\frac{1}{2}, \frac{1}{4})$ since $(\frac{1}{2}, \frac{1}{4}) = \bigcup_{n=1}^{\infty} (\frac{1}{4}, \frac{1}{2} - \frac{1}{n}]$
 $(\frac{1}{4} - \frac{1}{n}, \frac{1}{4} + \frac{1}{n}] \downarrow \{\frac{1}{4}\} \dots$ increase as sets.

e.g. $\Omega = (0, 1]$

\mathcal{F} = Finite disjoint unions of intervals $(a, b] \subset \Omega$

\mathcal{F} is a field but not a σ -field since
 $(\frac{1}{2}, \frac{1}{4}) \notin \mathcal{F}$ but $(\frac{1}{2}, \frac{1}{4}) = \bigcup_{n=1}^{\infty} (\frac{1}{4}, \frac{1}{2} - \frac{1}{n}] \in \mathcal{F}$

e.g. 2^{Ω} satisfies the conditions of all 5 def's.
... so they are not vacuous.

Note: fields & σ -fields are closed under

$$A \cap B = (A^c \cup B^c)^c$$

$$A - B = A \cap B^c$$

$$A \Delta B = (A - B) \cup (B - A)$$

Note: λ -systems are not necessarily
closed under intersection.

e.g. $\Omega = \{1, 2, 3, 4\}$

$\mathcal{F} = \{\{1, 2\}, \{2, 3\}, \{1, 4\}, \{3, 4\}, \emptyset, \Omega\}$
 is a λ -sys but $\{2\} = \{1, 2\} \cap \{2, 3\} \notin \mathcal{F}$.

Note: λ -systems are closed under nested set subtraction. (3)

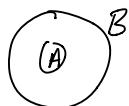

i.e. if F is a λ -system then

$$A, B \in F \text{ & } A \subset B \Rightarrow B - A = B \cap A^c$$

$$= (B^c \cup A) \cap A^c$$

disjoint

$$\in F.$$

Note: For any $A_1, A_2, \dots \in 2^{\omega}$

$$\begin{array}{ccc} \bigcup_{k=1}^n A_k & \uparrow & \bigcup_{k=1}^{\infty} A_k \\ \downarrow & & \downarrow \\ \bigcap_{k=1}^n A_k & & \bigcap_{k=1}^{\infty} A_k \end{array} \quad \left. \begin{array}{l} \text{so monotone} \\ \text{classes are} \\ \text{closed under} \\ \text{countable} \\ \text{intersection} \\ \text{& union.} \end{array} \right\}$$

$$\sigma = \lambda + \pi = f + m$$

Thm: If $F \subset 2^{\omega}$ then

$$\begin{aligned} F \text{ is a } \sigma\text{-field} &\iff F \text{ is a } \lambda\text{-system \& a } \pi\text{-system} \\ &\iff F \text{ is a field \& a monotone class.} \end{aligned}$$

Proof:

($\sigma \Rightarrow \lambda + \pi$): Trivial

($\sigma \Leftarrow \lambda + \pi$): Suppose F is a λ -sys \& a π -sys.

All we need to show is that F is closed under countable non-disjoint unions. We use a trick that we'll use later.

Let $A_1, A_2, \dots \in F$.

$$\begin{aligned} \bigcup_{n=1}^{\infty} A_n &= \bigcup_{n=1}^{\infty} A_n - \underbrace{(A_1 \cup \dots \cup A_{n-1})}_{\substack{\text{only add in unique points} \\ \text{these are disjoint}}} \\ &= \bigcup_{n=1}^{\infty} A_n \cap A_1^c \cap \dots \cap A_{n-1}^c \\ &\in F. \end{aligned}$$

$\uparrow \uparrow$ in F by λ -sys.
 $\uparrow \uparrow$ in F by π -sys.

($\sigma \Rightarrow f + m$): Suppose F is a σ -field (4)

Clearly F is a field.

Let $A_1, A_2, \dots \in F$

$$A_n \uparrow A \Rightarrow A = \bigcup_{n=1}^{\infty} A_n \in F \text{ by } \sigma\text{-field prop}$$

$$A_n \downarrow A \Rightarrow A = \bigcap_{n=1}^{\infty} A_n = \left(\bigcup_{n=1}^{\infty} A_n^c \right)^c \in F$$

($\sigma \Leftarrow f + m$): All we need to show is

$$A_1, A_2, \dots \in F \Rightarrow \bigcup_{n=1}^{\infty} A_n \in F$$

follows by $\bigcup_{n=1}^N A_n \uparrow \bigcup_{n=1}^{\infty} A_n \in F$ by all props.

QED.

Generators

Let $C \subset 2^{\omega}$ & define

$\sigma(C) = \sigma\text{-field generated by } C$

$$:= \bigcap_{\substack{F \text{ is a } \sigma\text{-field} \\ C \subset F}} F$$

Define $f(C)$, $\lambda(C)$, $m(C)$ similarly.

Thm: $\sigma(C)$ is a σ -field containing C .

Proof:

• $C \subset \sigma(C)$ since \exists a σ -field F s.t. $C \subset F$ i.e. $F = 2^{\omega}$

• $\emptyset \in F$, $\forall \sigma$ -fields F so $\sigma(C)$ is not empty

$$\begin{aligned} \bullet A \in \sigma(C) &\Rightarrow A \in F, \text{ if such } F \\ &\Rightarrow A^c \in F, \text{ if such } F \\ &\Rightarrow A^c \in \sigma(C). \end{aligned}$$

• Countable additivity is similar QED.

Same goes for $\lambda(\mathcal{C})$, $f(\mathcal{C})$ & $M(\mathcal{C})$. (5)

e.g. $B_{\sigma}^{(0,1]}$ = finite disjoint unions of sets $(a, b] \subset (0, 1]$.

$B^{(0,1]}$ = $\sigma(B_{\sigma}^{(0,1)})$ is called the Borel σ -field of $(0, 1]$

$B^{(0,1]}$ is very rich. It contains all closed, open, one point, countable sets.

Also note, $N \in B^{(0,1)}$
 ↪ set of Normal numbers.

To see why:

$$\begin{aligned} w \in N &\iff \lim_n \frac{s_n(w)}{n} = 0 \\ &\iff \forall \epsilon \exists m \text{ s.t. } \forall n \geq m \quad \left| \frac{s_n(w)}{n} \right| < \frac{\epsilon}{k} \end{aligned}$$

$$\iff w \in \bigcap_m \bigcup_{n \geq m} \left\{ \left| \frac{s_n}{n} \right| < \frac{1}{k} \right\} \hookrightarrow B_{\sigma}^{(0,1]}$$

Important Fact: There is no simple recipe for general $A \in \sigma(\mathcal{C})$, i.e. $\exists A \in \sigma(\mathcal{C})$ s.t.

$$A \neq \bigcup_{n=1}^{\infty} C_n$$

for any choice of $C_n \in \mathcal{C}$.

(6)

This makes it hard to prove things about $\sigma(\mathcal{C})$. Here is the main tool you can use.

Suppose you want to show each $A \in \sigma(\mathcal{C})$ satisfies some property.

Let $\mathcal{G} \subset 2^{\omega}$ be all sets that have this property ("the good sets").

Thm (good sets):

$$C \subset \mathcal{G} \implies \sigma(C) \subset \mathcal{G}$$

↑ a σ-field

i.e. if the generators \mathcal{C} are "good" & the "good sets" have enough closure properties then everything in $\sigma(\mathcal{C})$ is "good".

Proof: $\sigma(\mathcal{C}) = \bigcap \mathcal{F}$

$$\begin{cases} \mathcal{F} \text{ is } \sigma\text{-field} \\ \mathcal{C} \subset \mathcal{F} \end{cases}$$

\mathcal{G} is one of these so $\sigma(\mathcal{C}) \subset \mathcal{G}$
 a further restriction

QED.

Let's finish with an easy example of this technique.

Next time we will use it to full effect to prove Dynkin's π - λ Thm.

(8)

Thm: Let Ω be a sample space

⑨

$$\begin{aligned} \Omega_0 &\subset \Omega \\ \mathcal{C} &\subset 2^\Omega. \quad \text{a } \sigma\text{-field of } \Omega_0 \\ \text{Then } \sigma(\mathcal{C} \cap \Omega_0) &= \sigma(\mathcal{C}) \cap \Omega_0. \end{aligned}$$

Note: $\mathcal{F} \cap \Omega_0 := \{F \cap \Omega_0 : F \in \mathcal{F}\}$

Proof:

$$\sigma(\mathcal{C} \cap \Omega_0) \subset \sigma(\mathcal{C}) \cap \Omega_0.$$

Follows by good sets since

$$\underbrace{\mathcal{C} \cap \Omega_0}_{\text{generators}} \subset \underbrace{\sigma(\mathcal{C}) \cap \Omega_0}_{\text{good sets.}}$$

Form a σ -field
by an exercise

$\therefore \sigma(\mathcal{C} \cap \Omega_0) \subset \sigma(\mathcal{C}) \cap \Omega_0$ by good sets.

$$\sigma(\mathcal{C}) \cap \Omega_0 \subset \sigma(\mathcal{C} \cap \Omega_0).$$

Let $\mathcal{Y} \subset 2^\Omega$ include all sets s.t.

$$\mathcal{Y} \cap \Omega_0 \subset \sigma(\mathcal{C} \cap \Omega_0), \text{ i.e. } G \in \mathcal{Y} \text{ iff } G \cap \Omega_0 \in \sigma(\mathcal{C} \cap \Omega_0)$$

Clearly $\mathcal{C} \subset \mathcal{Y}$.
 \nwarrow Now just show \mathcal{Y} is a σ -field.

$$\checkmark \quad \forall \Omega \in \mathcal{Y} \quad \text{since } \sigma(\mathcal{C} \cap \Omega_0) \text{ is a } \sigma\text{-field on } \Omega_0$$

$\& \quad \Omega \cap \Omega_0 = \Omega_0 \in \sigma(\mathcal{C} \cap \Omega_0)$

$$\checkmark \quad \forall A \in \mathcal{Y} \Rightarrow A \cap \Omega_0 \in \sigma(\mathcal{C} \cap \Omega_0)$$

$$\Rightarrow \underbrace{A^c \cap \Omega_0}_{\text{complement of } A \text{ in } \Omega_0} \in \sigma(\mathcal{C} \cap \Omega_0)$$

$$\Rightarrow A^c \in \mathcal{Y}$$

$$\checkmark \quad \forall A_1, A_2, \dots \in \mathcal{Y} \Rightarrow A_k \cap \Omega_0 \in \sigma(\mathcal{C} \cap \Omega_0), \forall k$$

$$\Rightarrow \left[\bigcup_{k=1}^{\infty} A_k \right] \cap \Omega_0 \in \sigma(\mathcal{C} \cap \Omega_0)$$

\nwarrow can add these

$$\Rightarrow \bigcup_{k=1}^{\infty} A_k \in \mathcal{Y} \quad \text{QED.}$$
